This issue related to temporary files has been plaguing users for more than a year, yet Microsoft hasn't rolled out any official fixes to solve this problem, as users well remark This forum is a year old now with many followers all with the same problem and no one from Microsoft has stepped forward with a solution that actually works. So I do not believe you when you say "We will be glad to assist

you.” If I am wrong and Microsoft is working on solving this problem, then enlighten me regarding what is being done and I will gladly stand corrected. Alternatively, you can use a file deletion tool to do the job for you! 3. Use Disk Cleanup tool According to users, if you can't delete temporary files on Windows 10, you might want to try using Disk Cleanup tool. If you're not familiar, Disk Cleanup is a builtin application that will scan the selected drive and show you which temporary files are using most of your space. Thanks to this application, you can easily free up space and remove temporary files. Select Disk Cleanup from the menu. Make sure that your System drive, by default C, is selected and click OK. Wait while your PC scans the C drive. Select the files you want to remove and click OK. If you want, you can click Clean system files button in order to remove additional files. After doing that, the temporary files should be removed and you'll free up some space on your system drive. 4. Use Command Prompt According to users, if you can't delete temporary files, you might be able to do so by using Command Prompt. Now choose Command Prompt Admin or PowerShell Admin from the list. Once the command is executed, all your temporary files should be deleted and the problem will be resolved. This is a quick and relatively simple solution, and if you don't want to delete your temporary files manually, be sure to try this solution. Working in Command Prompt will be a walk in the park after you read this guide! 5.

Install the latest updates According to users, sometimes the inability to remove temporary files is caused by a bug on your system. Bugs can interfere with your system and prevent you from performing certain operations, therefore it's crucial that you keep your system up to date. By default, Windows 10 automatically installs the missing updates, but sometimes you might miss an update or two. However, you can always check for updates manually by doing the following Open the Settings app. Now click Check for updates button. Windows 10 will check for available updates. If any updates are available, they will be downloaded automatically in the background. As for the updates, they will be installed as soon as you restart your PC. Once your PC is up to date, the problem should be resolved and you'll be able to remove temporary files without any problems. Windows updates won't install. Here's how to fix the issue like a pro! 6. Delete the contents of SoftwareDistribution directory Several users reported that they are unable to delete temporary files due to SoftwareDistribution directory. This folder holds Windows Update files, and sometimes it can prevent you from deleting certain files. However, you can easily solve this issue by deleting the contents of this directory. To do that, just follow these steps Make sure that Windows Update isn't downloading any updates. To do that, check for available updates. If no updates are available, you can proceed to the next step. Press Enter or click OK Select all files inside of the Download directory and delete them. After doing that, you should be able to remove temporary files without any issues. 7. Uninstall Skype and Spotify According to users, sometimes thirdparty applications such as Skype and Spotify can interfere with your system and cause problems with temporary files. According to users, the issue started appearing after the update when these two applications were installed automatically.

However, you can fix the problem simply by removing these apps. To do that, just follow these steps Open the Settings app, and go to Apps section. List of installed applications will appear. Select Skype on the list and click Uninstall. Now follow the instructions on the screen to remove the application. Repeat the same steps for the Spotify app. This is a strange problem, but several users solved it by removing these two apps, so feel free to try it out. 8. Remove the temporary files from Safe Mode If you're having problems with temporary files, you might want to try removing them from Safe Mode. To access Safe Mode, do the following Open the Start Menu. Click the Power button, press and hold the Shift key and choose Restart from the menu. Once your PC restarts, you'll be presented with a list of options. Select any version of Safe Mode by pressing the corresponding key. Once you enter Safe Mode, you should be able to remove temporary files without any issues. Can't enter in Safe Mode. Don't panic! We got your back with our excellent guide. Not being able to remove temporary files can be a big problem sometimes, but you should be able to fix it with one of

our solutions. Editor's Note This post was originally published in May 2018 and has been since revamped and updated in July 2020 for freshness, accuracy, and comprehensiveness. Was this page helpful.
